

Dataflow are pleased to announce the Multihaul eDriver platform with the release of two web based modules giving the driver the opportunity to update jobs, capture signature for proof of delivery, take photos and report back to base of any vehicle defect whilst on the move.

MULTIHAUL IN-CAB APP

Multihaul In-Cab software is the answer to the urgent demand for a fast, accurate, cost effective and easily accessible delivery service using Android technology. Easy to learn software for small to large businesses, that reduces manual processes, phone calls, emails and kills off paperwork.

Multihaul In-Cab is an advanced delivery software, which features an electronic proof of delivery app all-in-one mobile solution for efficient real-time driver performance monitoring and delivery confirmation.

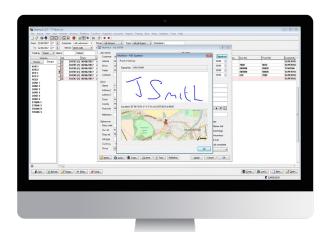

This is a paperless system which also works for arranging multiple deliveries with ease. Sign on glass, instant notification and electronic proof of delivery (e-POD).

It can easily capture signatures and photographs to be used as proof that the delivery was successful. Once the delivery is signed for, Multihaul In-Cab will instantly send feedback about the status with an actual quantity of items into Multihaul.

Multihaul In-Cab app does everything you need for confirmation: timestamps, takes photos, grabs clients' signatures and directs you to destination. In-Cab gives you the possibility to capture recipients' eSignatures with the sign on glass technology, reducing your paperwork and invoicing errors.

Once goods are collected/delivered the app enables the driver to take photos of the collection, delivery, product, boxes, pallets etc, and at the point of e-Signature the job status within Multihaul is automatically updated.

MULTIHAUL VEHICLE DEFECT REPORTING APP

The Multihaul Vehicle Defect Reporting App is an Android devices application that allows drivers to quickly and accurately perform the daily vehicle walk around inspection.

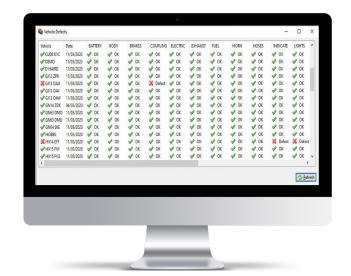

The app replaces the daily defect paper book with a list of on-screen tick boxes tailored specifically to the driver's vehicle. Any defect can be photographed to record the exact condition as part of the defect report. The driver can then provide additional information if necessary.

Defect reports are instantly sent back to the traffic office, and are automatically recorded against the vehicle in Multihaul, giving the traffic manager a fully up-to-date overview of the condition of the fleet.

Repairs can then be scheduled or replacement vehicles arranged, all without having to wait for the driver to return to the office to submit their defect reports. As all defect reports are transmitted electronically to the traffic office there is no risk of reports being mislaid by the driver.

Multihaul can highlight any overdue reports, ensuring that a full inspection record is always maintained for each vehicle.
